Thermal Design of NVSU333A (U385) LEDs

1. Objective

The LEDs' light output can be affected by the heat generated from the LEDs/LED-assembled products.
Also, the reliability performance can be seriously degraded, if the LEDs are operated over the absolute maximum rated junction temperature (Tj).
It is critical to design the heat dissipation performance not to exceed the T_{jmax} for NVSU333A, to deliver high reliability/performance.
This document shows the Tj evaluation results by demonstrating three heat dissipation conditions. Please use the data for reference to your thermal design.

2. Tj Calculation

Tj can be calculated by the following formula:

$$Tj = Ts + Rthj\text{-}s \times P_D$$

Tj: Junction Temperature
Ts: Soldering Temperature (°C)
Rthj-s: Thermal resistance (°C/W) from the die to the Ts measuring point
* Rthj-s (NVSU333A): 2.08°C/W
PD: Input Power (W)
